The report below shows BPT achievement rates for all Trusts in England in the 2nd Quarter of the 2018-19 financial year.

To ascertain compliance, NELA cases recorded within this quarter and locked within the published timeframe were included. Providers and Commissioners should monitor case ascertainment to ensure that cases recorded and locked in the NELA system reflect adequately the Trust activity. Commissioners may decide not to pay the enhanced BPT if the number of cases recorded in the NELA system is deemed inadequate.

The NELA Online Dashboard holds Quality Improvement graphs on individual performance in metrics that Trusts may wish to consult for a better understanding of BPT performance at Hospital level.

*Please note, this current report is intended to provide indicative information about performance in the BPT in advance of the BPT commencing. This report still includes the POSSUM method in determining risk of mortality. From April 2019, BPT reports will assign high risk as described below i.e. using NELA risk score and Clinical Judgement only. However the current report includes instances where POSSUM identifies a patient as high risk, but NELA risk and clinical judgement identify the patient as low risk. Given that this occurs in less than 1.5% of patients, this current report still provides a useful indicator of performance.*

**About the NELA BPT metric**

Trusts may qualify for the BPT, if 80% of their NELA high risk patients had a Consultant Surgeon and a Consultant Anaesthetist present during surgery and were admitted directly to critical care. The same patient needs to have received both elements of care.

To determine the BPT achievement rates, the following definitions of numerator and denominator have been considered:

**Denominator** - Includes all locked cases within the quarter based on the date of surgery (variable: `S04ArrivalInTheatreDatetime`), with a high risk mortality. Excludes patients who died in theatre. High risk patients, in the context of the BPT, are defined by a predicted hospital mortality >= 5% pre and post-operative. The predicted mortality will be based on either the NELA or Clinical Judgement scores. If the risk score differs between these methods, the highest predicted risk category will be used. Patients with no documented risk, will be considered high risk.

**Numerator** - The number of cases for which a Consultant Surgeon and a Consultant Anaesthetist were present in the theatre and with a direct a CCU admission.

The variables required to calculate the numerator are: `S04Aaes_Grade` (with "Consultant" selected), `S04Surg_Grade` (with "Consultant" selected), & `S06Proc_Dest` (where level 2 HDU or level 3 ICU are selected)

**Estimated Case ascertainment** - The estimated case ascertainment is based on the estimated caseload (derived HES data) from procedures performed between December 2016 and November 2017 by the Hospital(s) under the same Trust.

**Contacts**

NELA FAQs on the BPT can be found [here](#). Please contact the NELA team for any questions about the audit or data collection.
